How to Run on Your Local Machine

Option 1: Using Docker Compose (Recommended)

1. **Configure Environment Variables** (Optional, for Gemini AI features):

   code Bash

   ```
   cp .env.example .env
   ```

   Add your Gemini API key inside `.env`:

   code Bash

   ```
   GEMINI_API_KEY=your_gemini_api_key_here
   ```

   (If left blank, the app will run in offline mode without AI assessments).

2. **Build and Launch**:

   code Bash

   ```
   docker compose up --build
   ```

3. **Access the Application**:
   Open http://localhost:3000 in your browser.

4. **(Optional) Mount Custom Signals**:
   Place any custom `signals.geojson` file into the `./data/` folder on your host machine. The container will automatically load it.

Option 2: Running Directly with Node.js

code Bash

```
# 1. Install dependencies
npm install

# 2. Start full-stack development server
npm run dev
# Or build and run in production mode:
npm run build && npm start
```

The server will start on http://localhost:3000.
